SUMMARY

Self-taught software engineer with 5+ years of experience, and usually the person who owns the whole thing — the design, the code, the deploy, and whatever breaks afterwards. The Python services and data pipelines behind executive reporting at a Fortune 50 retailer, a machine-learning trading platform built to throw out its own bad ideas, and a one-person iOS studio with **three apps on the App Store**. I would rather ship one thing that holds up when someone checks it than three that look good until they do.

EXPERIENCE

Founder & Lead Software Engineer Jan 2026 – Present

IF Development • Remote

- Run a one-person iOS studio — product design, code, artwork, websites, store listings and releases. Shipped **three apps to the App Store** (Starsplit, Choice Bible, Idle Space Mining) and have kept shipping updates since.
- Wrote custom C++ extensions for the Godot game engine to reach iOS features it does not cover on its own — push notifications, in-app purchases and ads — and set up the whole release process from scratch: signing certificates, provisioning profiles, automated builds and App Store review.
- Every app ships with its own website, built as plain HTML with no analytics and no third-party requests, so the privacy policy is something a reader can check rather than take my word for.

Stack Godot • C++ • GDScript • iOS / iPadOS / macOS • StoreKit / IAP • App Store Connect

Software Engineer Jan 2023 – Dec 2025

Lowe's Home Improvement • Charlotte, NC

- Built and maintained the Python web services (Flask, FastAPI) used by **500+ employees**, including the reporting that went up to the executive team.
- Owned the data pipelines that moved and cleaned roughly **150GB of data a month** and fed the React dashboards executives used to make decisions worth **\$15M+**.
- Automated the repetitive parts of our security tooling: threat alerts, patching machines, firewall rules and compliance reports.

Stack Python • Flask • FastAPI • React • SQL • ETL • microservices

Merchandising Service Associate Apr 2022 – Jan 2023

Lowe's Home Improvement • Coralville, IA

- Ran the teams that built in-store product displays. Our electronic price signs only fit one kind of display, so I designed and 3D-printed an adapter on my own time that let the store reuse them on any of them.

PROJECTS

Starsplit — puzzle game for iPhone and iPad 2026 • live

Solo • free on the App Store • starsplit.app

- A match-3 game built around one real decision per level: a star appears, and you pick which of four shapes it breaks into. **600 levels across six chapters**, each chapter introducing a rule the game has not used before.
- Difficulty is measured rather than guessed. A bot plays every level thousands of times before release and the move limit comes from what it finds, so a level that beats you is one you can learn instead of one you got unlucky on. Runs entirely on the device — no account, no internet required, no ads.

Choice Bible — reader for iPhone, iPad and Mac 2026 • live

Solo • free on the App Store • choicebible.com

- **Seven translations and the entire search index ship inside the app**, so every feature works with no signal. Gives readers the typography controls a print designer expects — twelve typefaces, justification, hyphenation, spacing and margins.
- Notes, highlights and reading position sync across iPhone, iPad and Mac through the reader's own iCloud account — no account to create, no server of mine, and nothing for me to see.

Solo · free on the App Store · idlespacemining.app

- Twelve production systems, branching upgrade paths the player commits to, and two layers of reset that trade everything owned for permanent bonuses. Keeps running while the app is closed.
- No ads, no energy timers and no countdown offers — nothing interrupts play to ask for money.

Sole architect and engineer · overview: github.com/isaacfrett/quant-public

A machine-learning platform that researched futures trading strategies, tested them honestly, and ran the few that survived against a live broker account. The design starts from the assumption that most ideas are bad and makes them prove otherwise.

- Built roughly **700 model inputs** from 50+ reusable components, with an automated check that none could accidentally see the future — a bug that makes results look excellent and be worth nothing, so finding one blocked the release.
- Strategies were scored only on data they had never seen, and the scoring corrected for how many thousands of ideas had been tried — the difference between real edge and luck.
- Trading fees were subtracted before anything was scored, so the bar was "still profitable after costs" rather than "profitable on paper". Two models worked together: one predicted direction, a second decided whether that prediction was worth acting on.
- Simulation and live trading had to behave identically, checked continuously — any difference stopped a release. Hard limits on position size, daily loss and drawdown, plus a kill switch. Monitored through a real-time React dashboard over a FastAPI backend.

Stack Python · LightGBM · scikit-learn · pandas · NumPy · Parquet/PyArrow · FastAPI · React + TypeScript · pytest (TDD-first)

Solo · github.com/isaacfrett/statlume-api

- Pulled NBA, NFL and MLB player game logs and betting lines from outside providers into a **MySQL warehouse**, refreshed weekly.
- Built models predicting individual player performance — points and rebounds — from recent-form data, and grouped NFL players into playing-style archetypes rather than ranking them on a single number.
- Generated formatted Excel reports so the output was readable instead of a table dump. Each league used the same package shape, so adding one was known work.

Stack Python · Django · TensorFlow/Keras · scikit-learn · MySQL · SQLAlchemy · Poetry · pytest

EDUCATION

Bellevue University · graduated, 4.0 GPA

Cybersecurity Club · Phi Theta Kappa Honors Society

SKILLS

LANGUAGES	Python · TypeScript · JavaScript · Java · SQL · C++ · GDScript · Bash
BACKEND	FastAPI · Flask · Django · REST APIs · microservices · ETL pipelines · SQLAlchemy
FRONTEND	React · TypeScript · Vite · responsive layout · accessibility
MOBILE	iOS · iPadOS · macOS · Godot · StoreKit / in-app purchases · App Store Connect
MACHINE LEARNING	LightGBM · scikit-learn · TensorFlow/Keras · PyTorch · pandas · NumPy · SciPy · PyArrow/Parquet · walk-forward cross-validation with purge/embargo · combinatorial purged CV · meta-labeling · probability calibration · deflated Sharpe · probability of backtest overfitting · feature-leakage auditing
